

# Introduction to Computer Graphics

GAMES101, Lingqi Yan, UC Santa Barbara

## Lecture 8: Shading 2 (Shading, Pipeline and Texture Mapping)

# Announcements

- Homework 2
  - 45 submissions so far
  - Upside down? No problem
  - Active discussions in the BBS, pretty good
- Next homework is for shading
- Today's topics
  - Easy, but a lot

# Last Lecture

- Shading 1
  - Blinn-Phong reflectance model
    - Diffuse
    - Specular
    - Ambient
  - At a **specific shading point**

# Today

- Shading 2
  - Blinn-Phong reflectance model
    - Specular and ambient terms
  - Shading frequencies
  - Graphics pipeline
  - Texture mapping
  - Barycentric coordinates

# Recap: Lambertian (Diffuse) Term

Shading **independent** of view direction

# Recap: Lambertian (Diffuse) Term

Produces diffuse appearance

$k_d \longrightarrow$

[Foley et al.]

# Specular Term (Blinn-Phong)

Intensity **depends** on view direction

- Bright near mirror reflection direction

# Specular Term (Blinn-Phong)

V close to mirror direction  $\Leftrightarrow$  **half vector near normal**

- Measure “near” by dot product of unit vectors

$$\begin{aligned}\mathbf{h} &= \text{bisector}(\mathbf{v}, \mathbf{l}) \\ &\text{(半程向量)} \\ &= \frac{\mathbf{v} + \mathbf{l}}{\|\mathbf{v} + \mathbf{l}\|}\end{aligned}$$

$$\begin{aligned}L_s &= k_s (I/r^2) \max(0, \cos \alpha)^p \\ &= k_s (I/r^2) \max(0, \mathbf{n} \cdot \mathbf{h})^p\end{aligned}$$

specularly  
reflected  
light

specular  
coefficient

# Cosine Power Plots

Increasing  $p$  narrows the reflection lobe

[Foley et al.]

# Specular Term (Blinn-Phong)

Blinn-Phong

$$L_s = k_s (I/r^2) \max(0, \mathbf{n} \cdot \mathbf{h})^p$$

Note: showing  
Ld + Ls together

[Foley et al.]

# Ambient Term

Shading that does not depend on anything

- Add constant color to account for disregarded illumination and fill in black shadows
- This is approximate / fake!

# Blinn-Phong Reflection Model

**Ambient + Diffuse + Specular = Blinn-Phong Reflection**

$$L = L_a + L_d + L_s$$

📄 
$$= k_a I_a + k_d (I/r^2) \max(0, \mathbf{n} \cdot \mathbf{l}) + k_s (I/r^2) \max(0, \mathbf{n} \cdot \mathbf{h})^p$$

**Questions?**

# Shading Frequencies

# Shading Frequencies

What caused the shading difference?

# Shade each triangle (flat shading)

## **Flat** shading

- Triangle face is flat — one normal vector
- Not good for smooth surfaces

# Shade each vertex (Gouraud shading)

## Gouraud shading

- **Interpolate** colors from vertices across triangle
- Each vertex has a normal vector (how?)

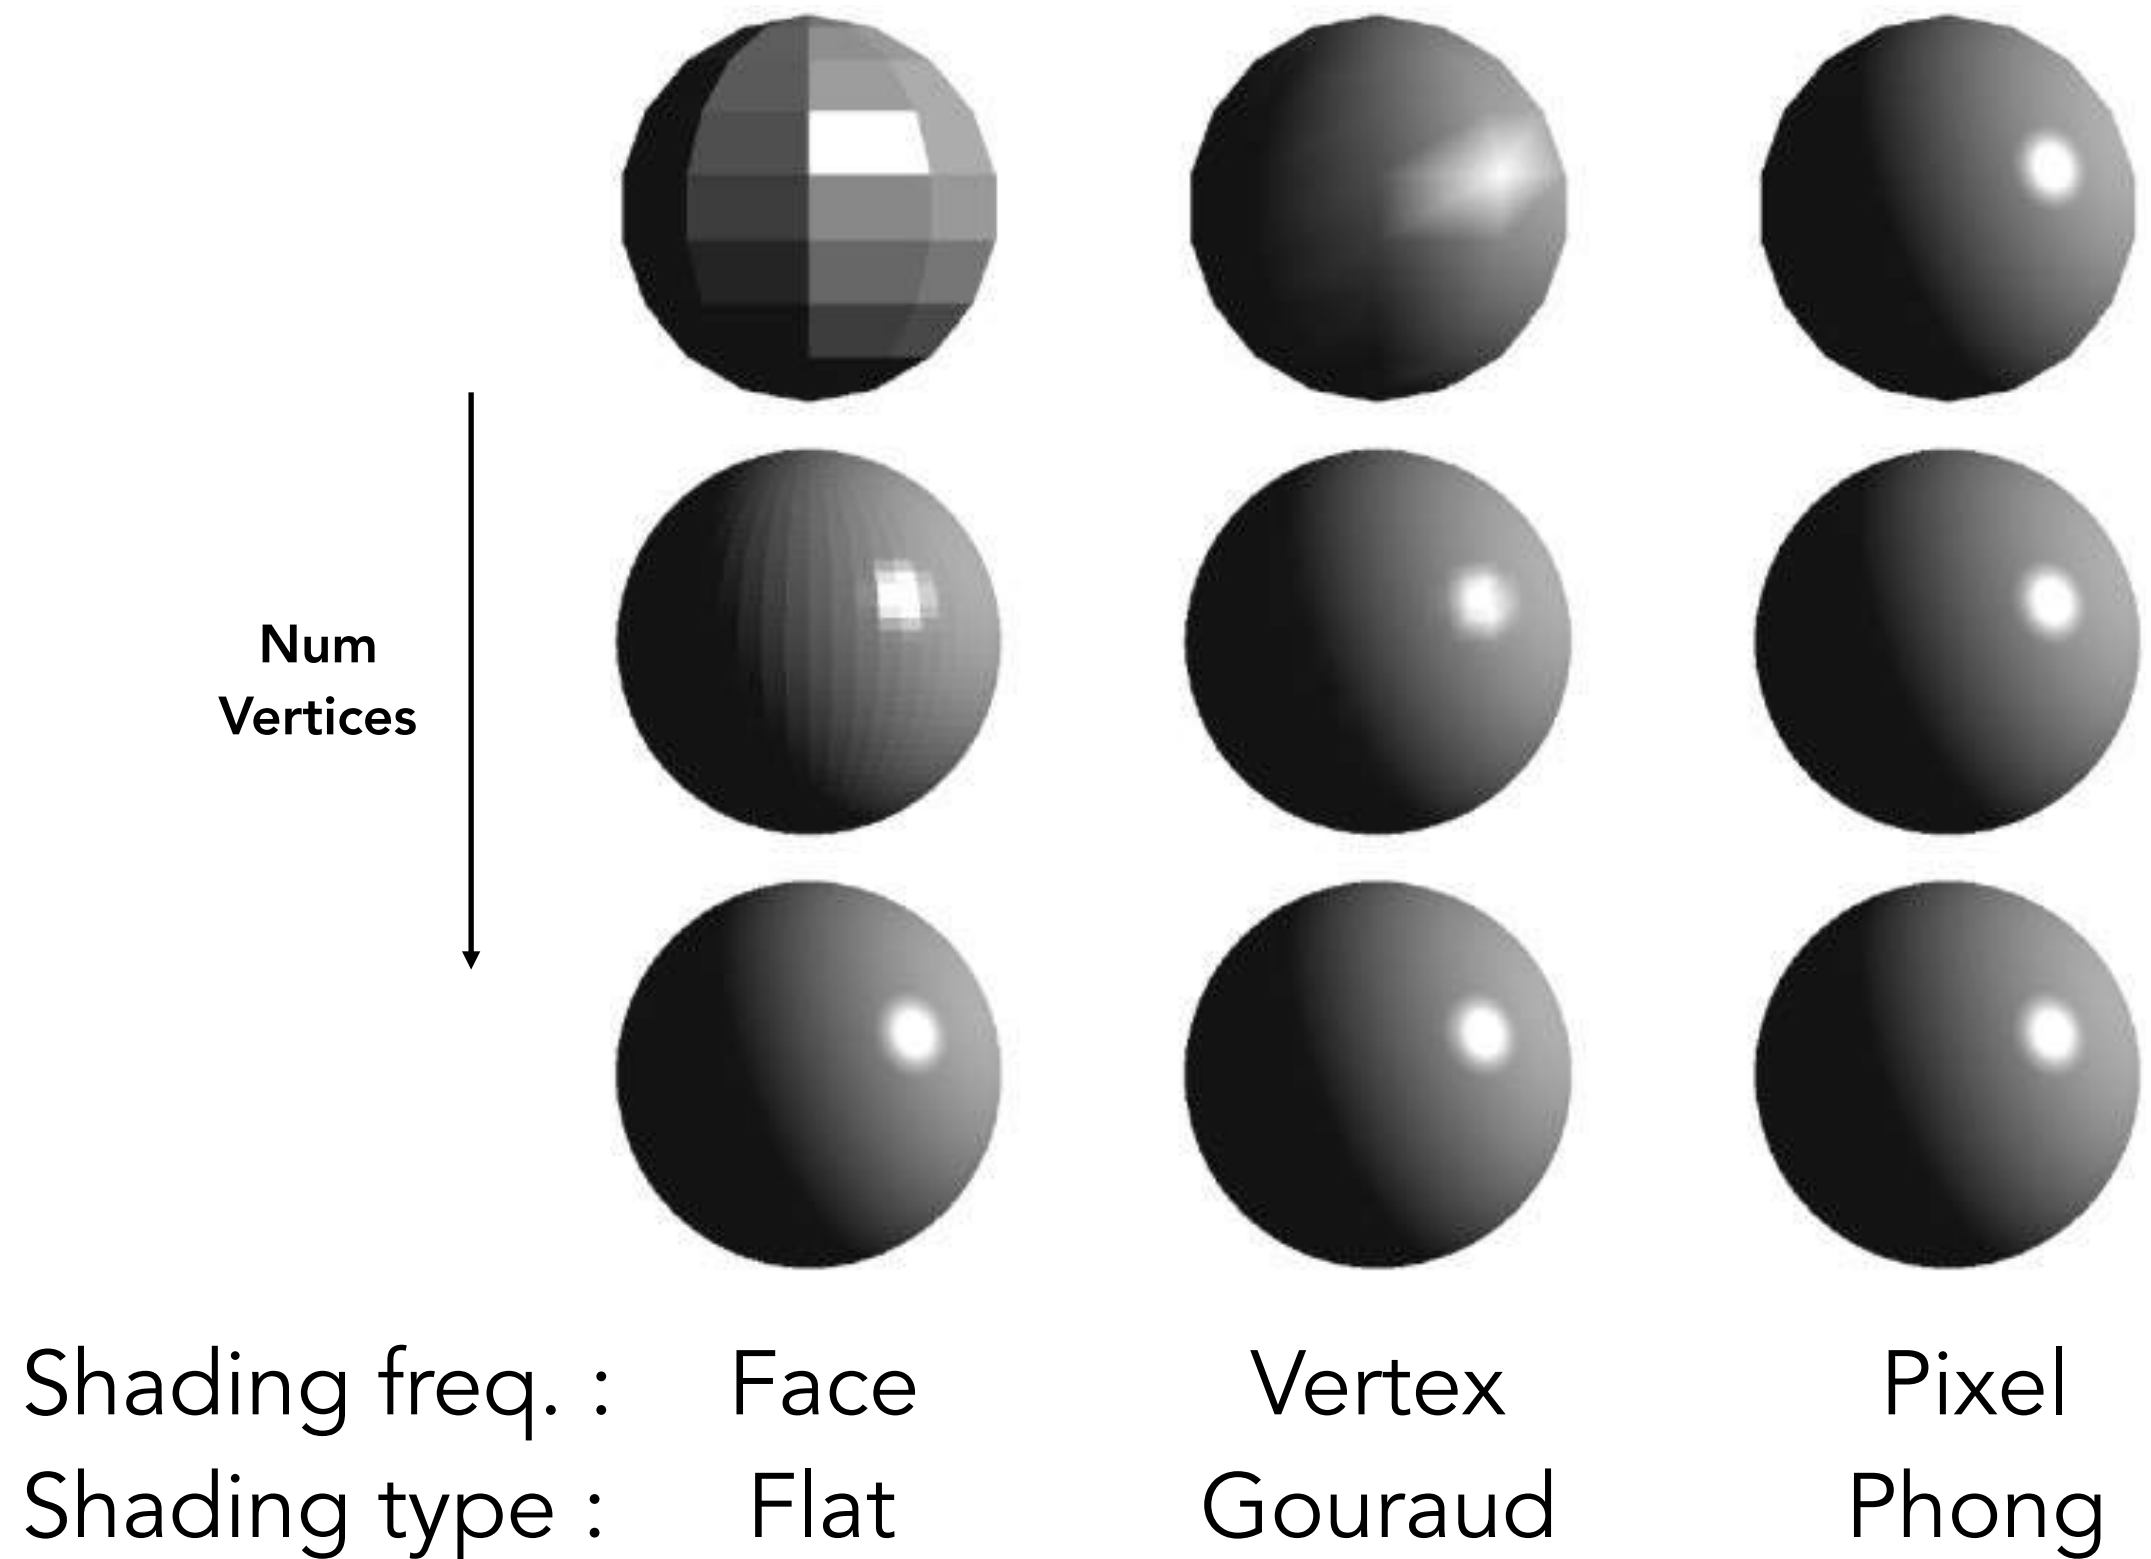

# Shade each pixel (Phong shading)

## Phong shading

- Interpolate normal vectors across each triangle
- Compute full shading model at each pixel
- Not the **Blinn-Phong Reflectance Model**

# Shading Frequency: Face, Vertex or Pixel

# Defining Per-Vertex Normal Vectors

Best to get vertex normals from the underlying geometry

- e.g. consider a sphere

Otherwise have to infer vertex normals from triangle faces

- Simple scheme: **average surrounding face normals**

$$N_v = \frac{\sum_i N_i}{\|\sum_i N_i\|}$$

# Defining Per-Pixel Normal Vectors

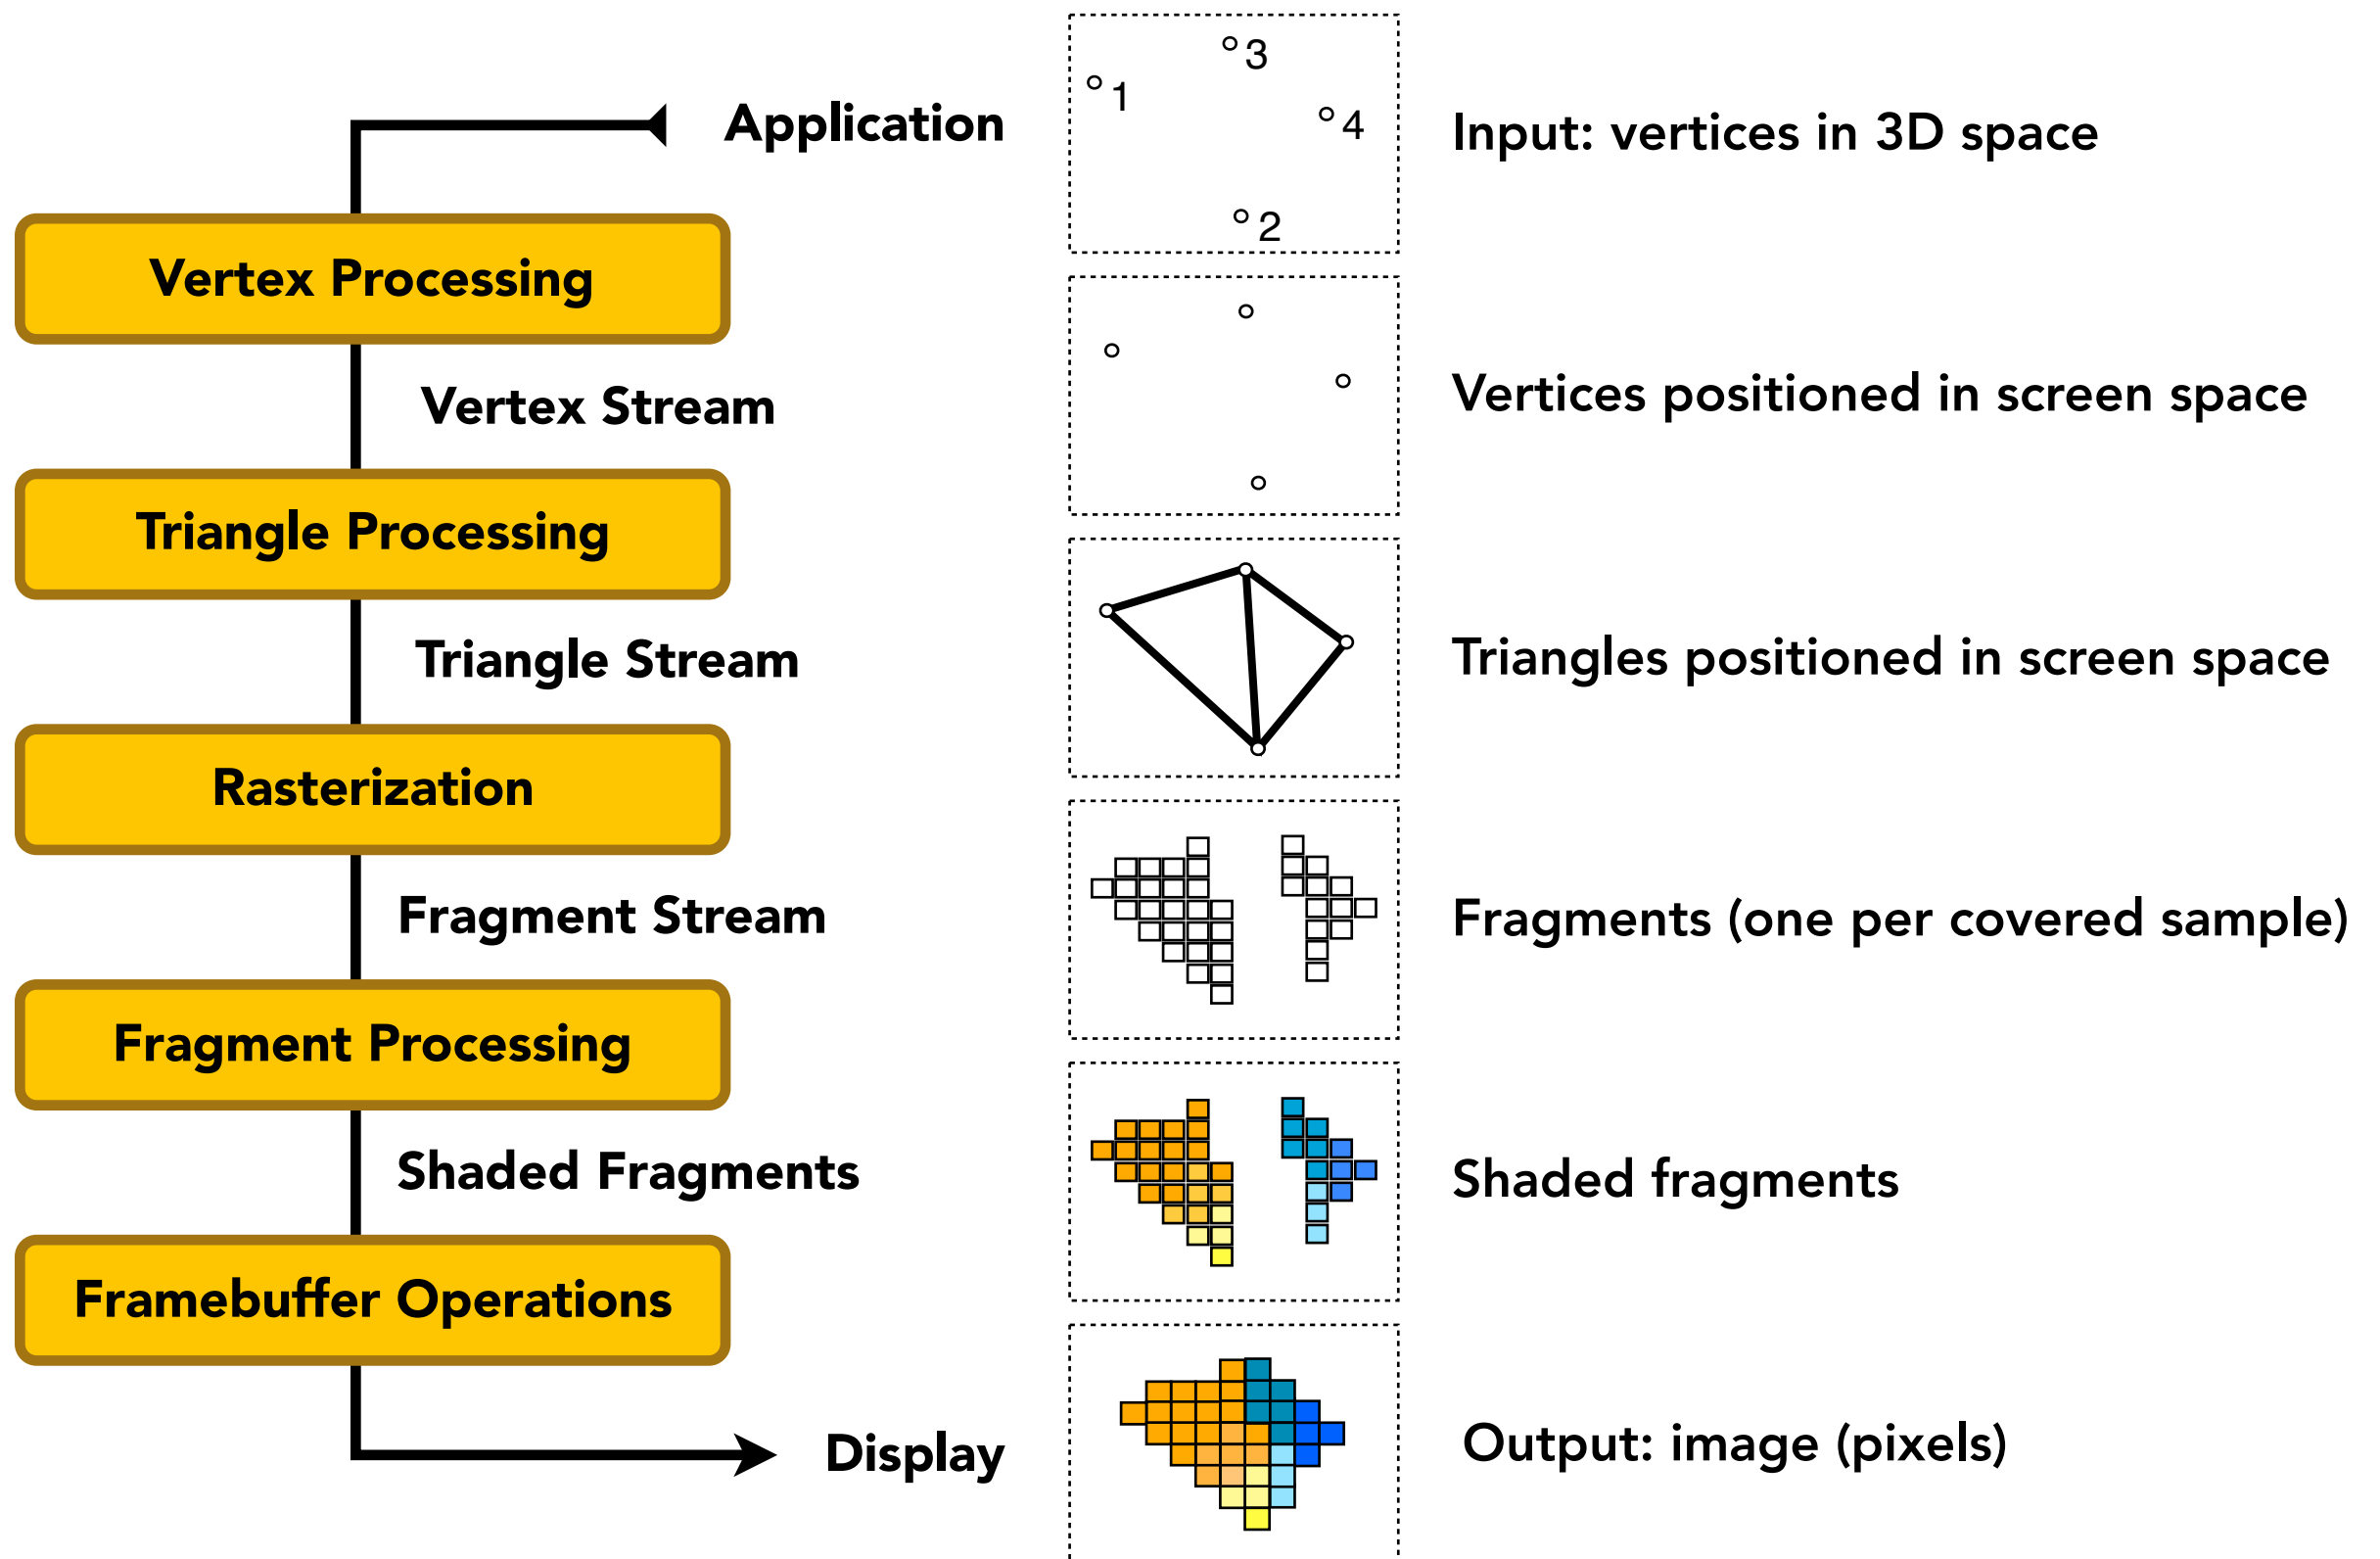

Barycentric interpolation (introducing soon)  
of vertex normals

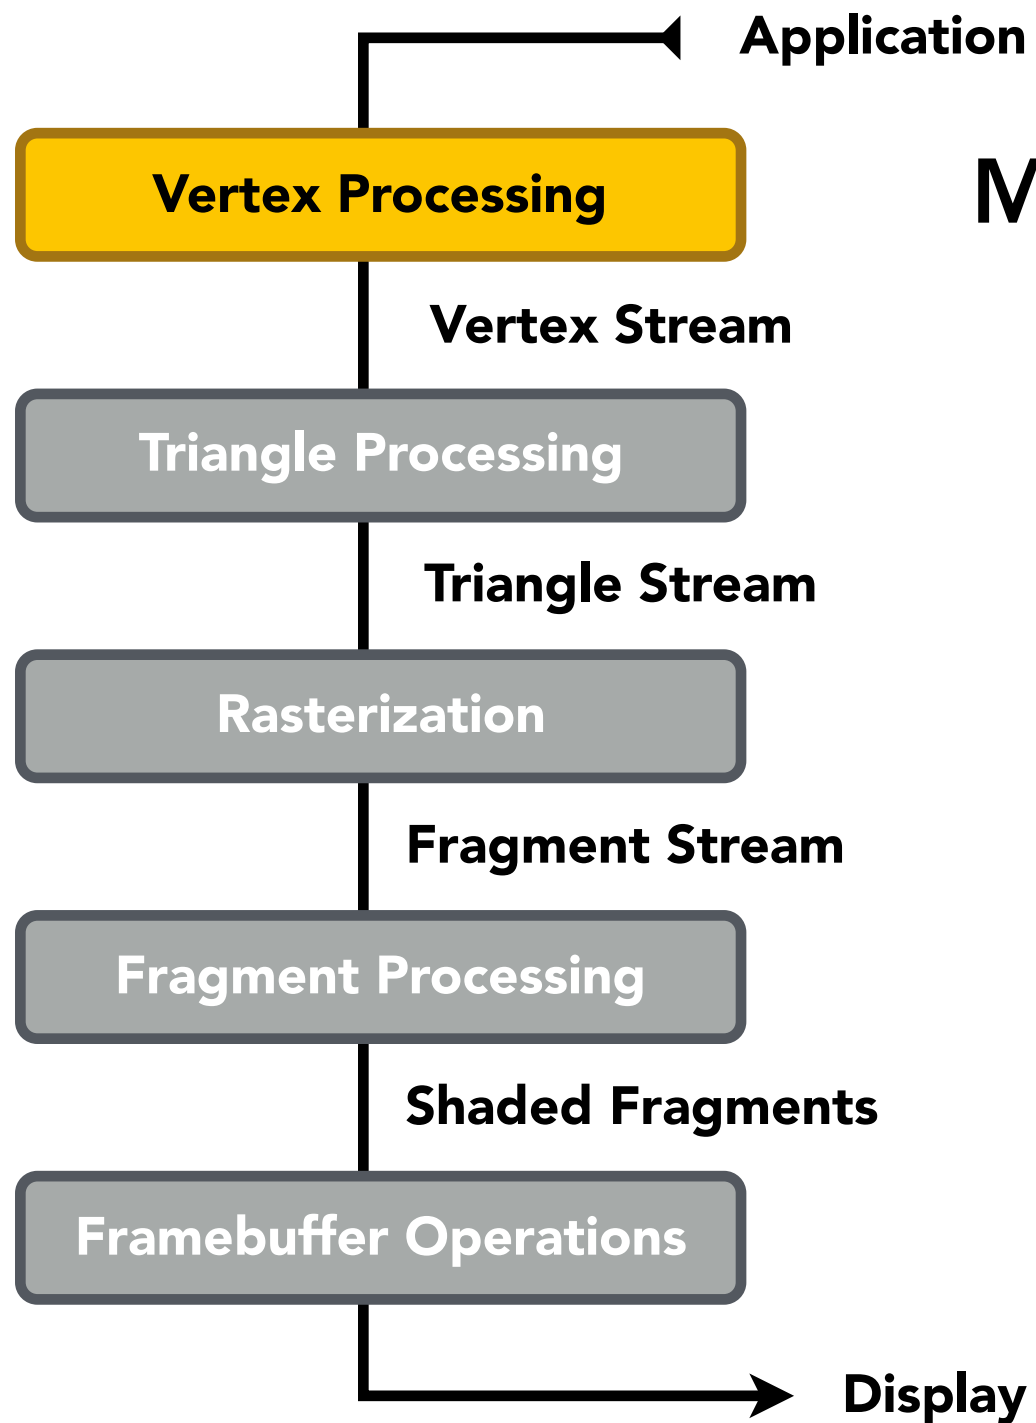

Don't forget to **normalize** the interpolated directions

# Graphics (**Real-time Rendering**) Pipeline

# Graphics Pipeline

# Graphics Pipeline

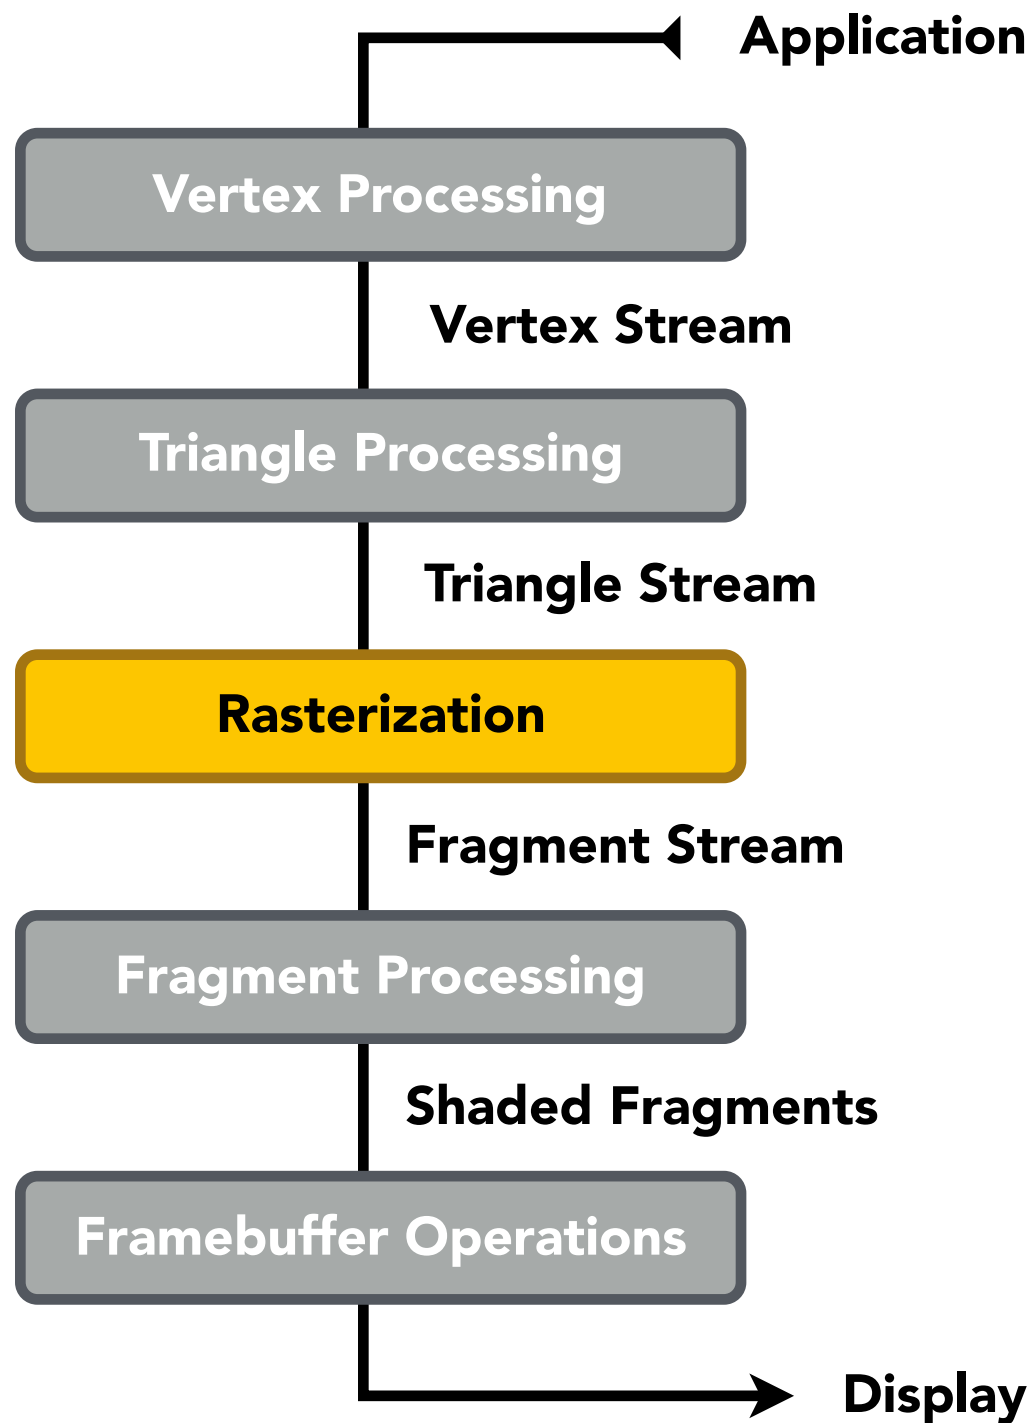

## Model, View, Projection transforms

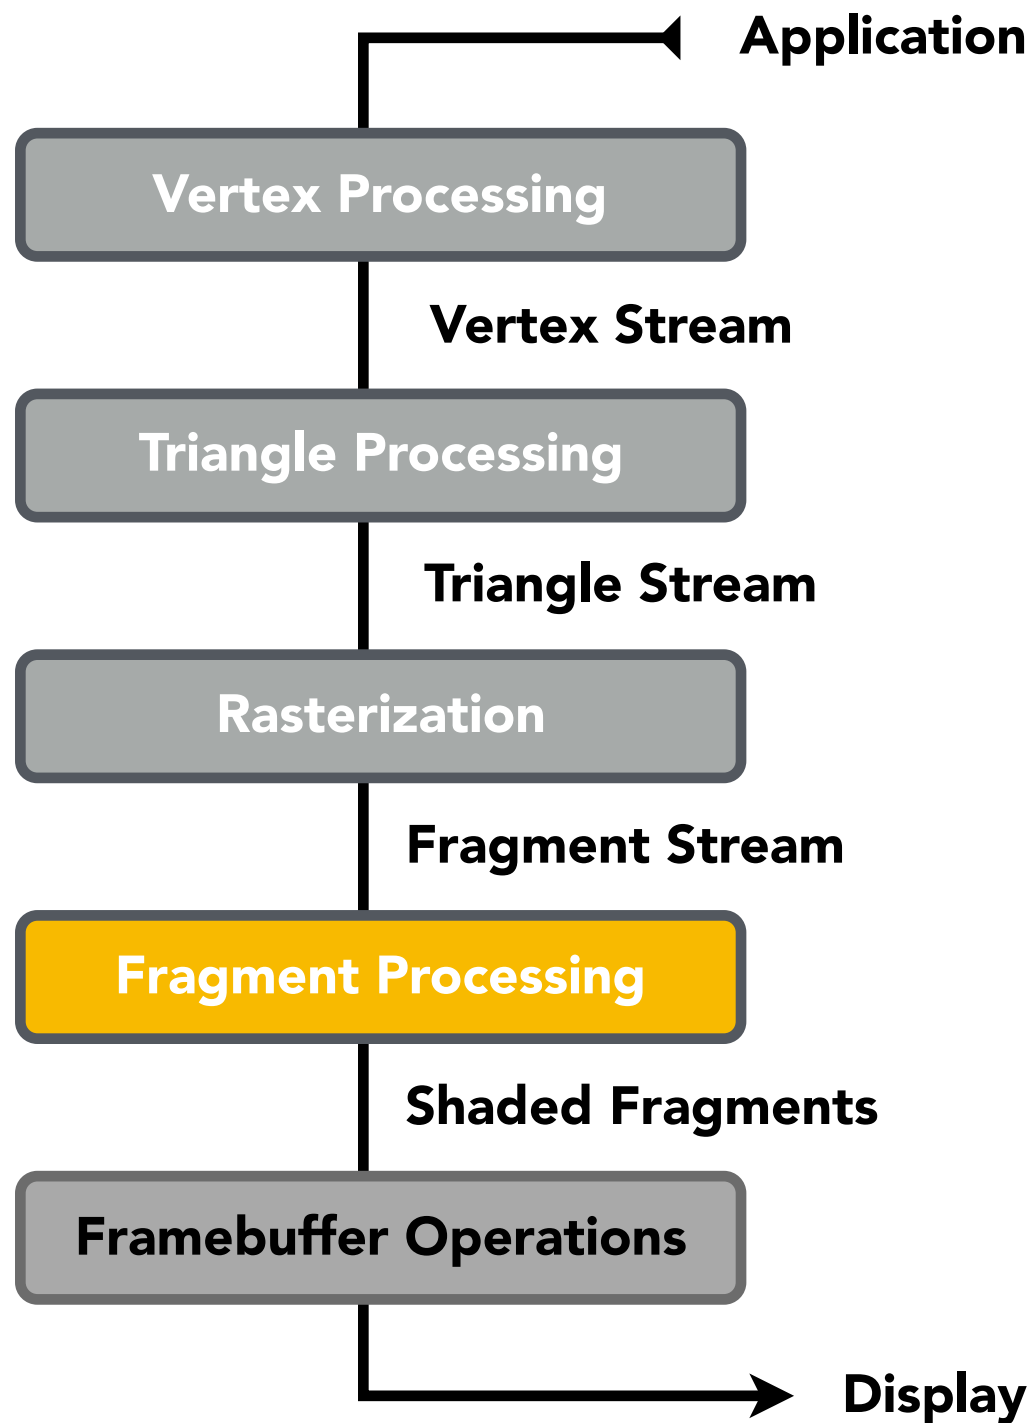

# Graphics Pipeline

## Sampling triangle coverage

# Rasterization Pipeline

## Z-Buffer Visibility Tests

# Graphics Pipeline

## Shading

Ambient

+

Diffuse

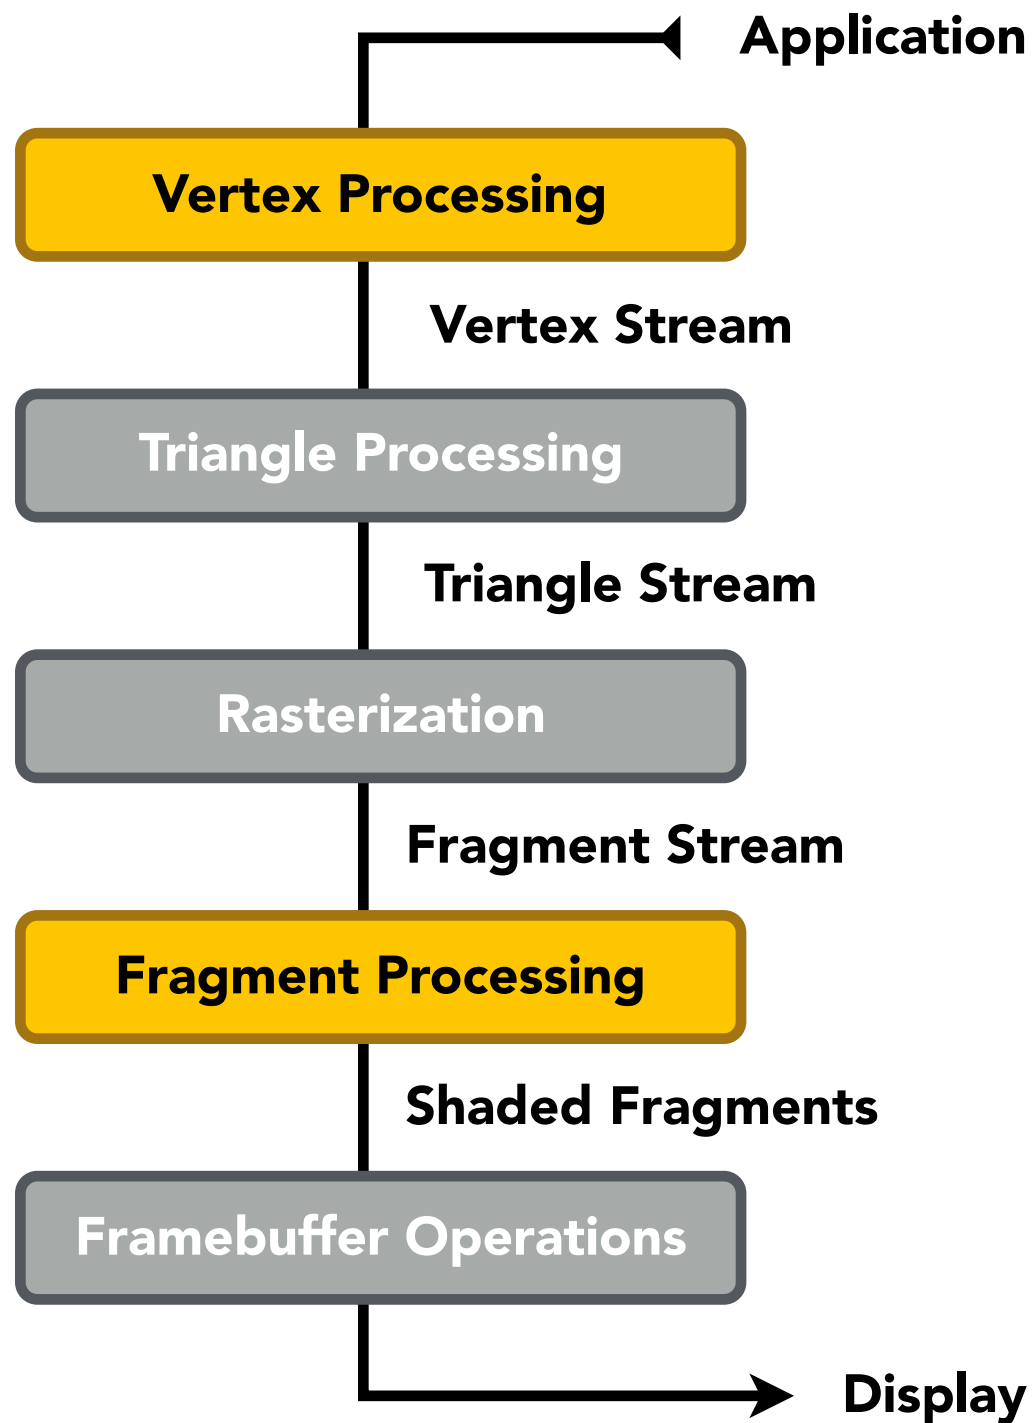

+ Specular

=

**Blinn-Phong  
Reflectance Model**

# Graphics Pipeline

**Texture mapping**  
(introducing soon)

# Shader Programs

- Program vertex and fragment processing stages
- Describe operation on a single vertex (or fragment)

Example GLSL fragment shader program

```
uniform sampler2D myTexture;  
uniform vec3 lightDir;  
varying vec2 uv;  
varying vec3 norm;  
  
void diffuseShader()  
{  
    vec3 kd;  
    kd = texture2d(myTexture, uv);  
    kd *= clamp(dot(-lightDir, norm), 0.0, 1.0);  
    gl_FragColor = vec4(kd, 1.0);  
}
```

- Shader function executes once per fragment.
- Outputs color of surface at the current fragment's screen sample position.
- This shader performs a texture lookup to obtain the surface's material color at this point, then performs a diffuse lighting calculation.

# Shader Programs

- Program vertex and fragment processing stages
- Describe operation on a single vertex (or fragment)

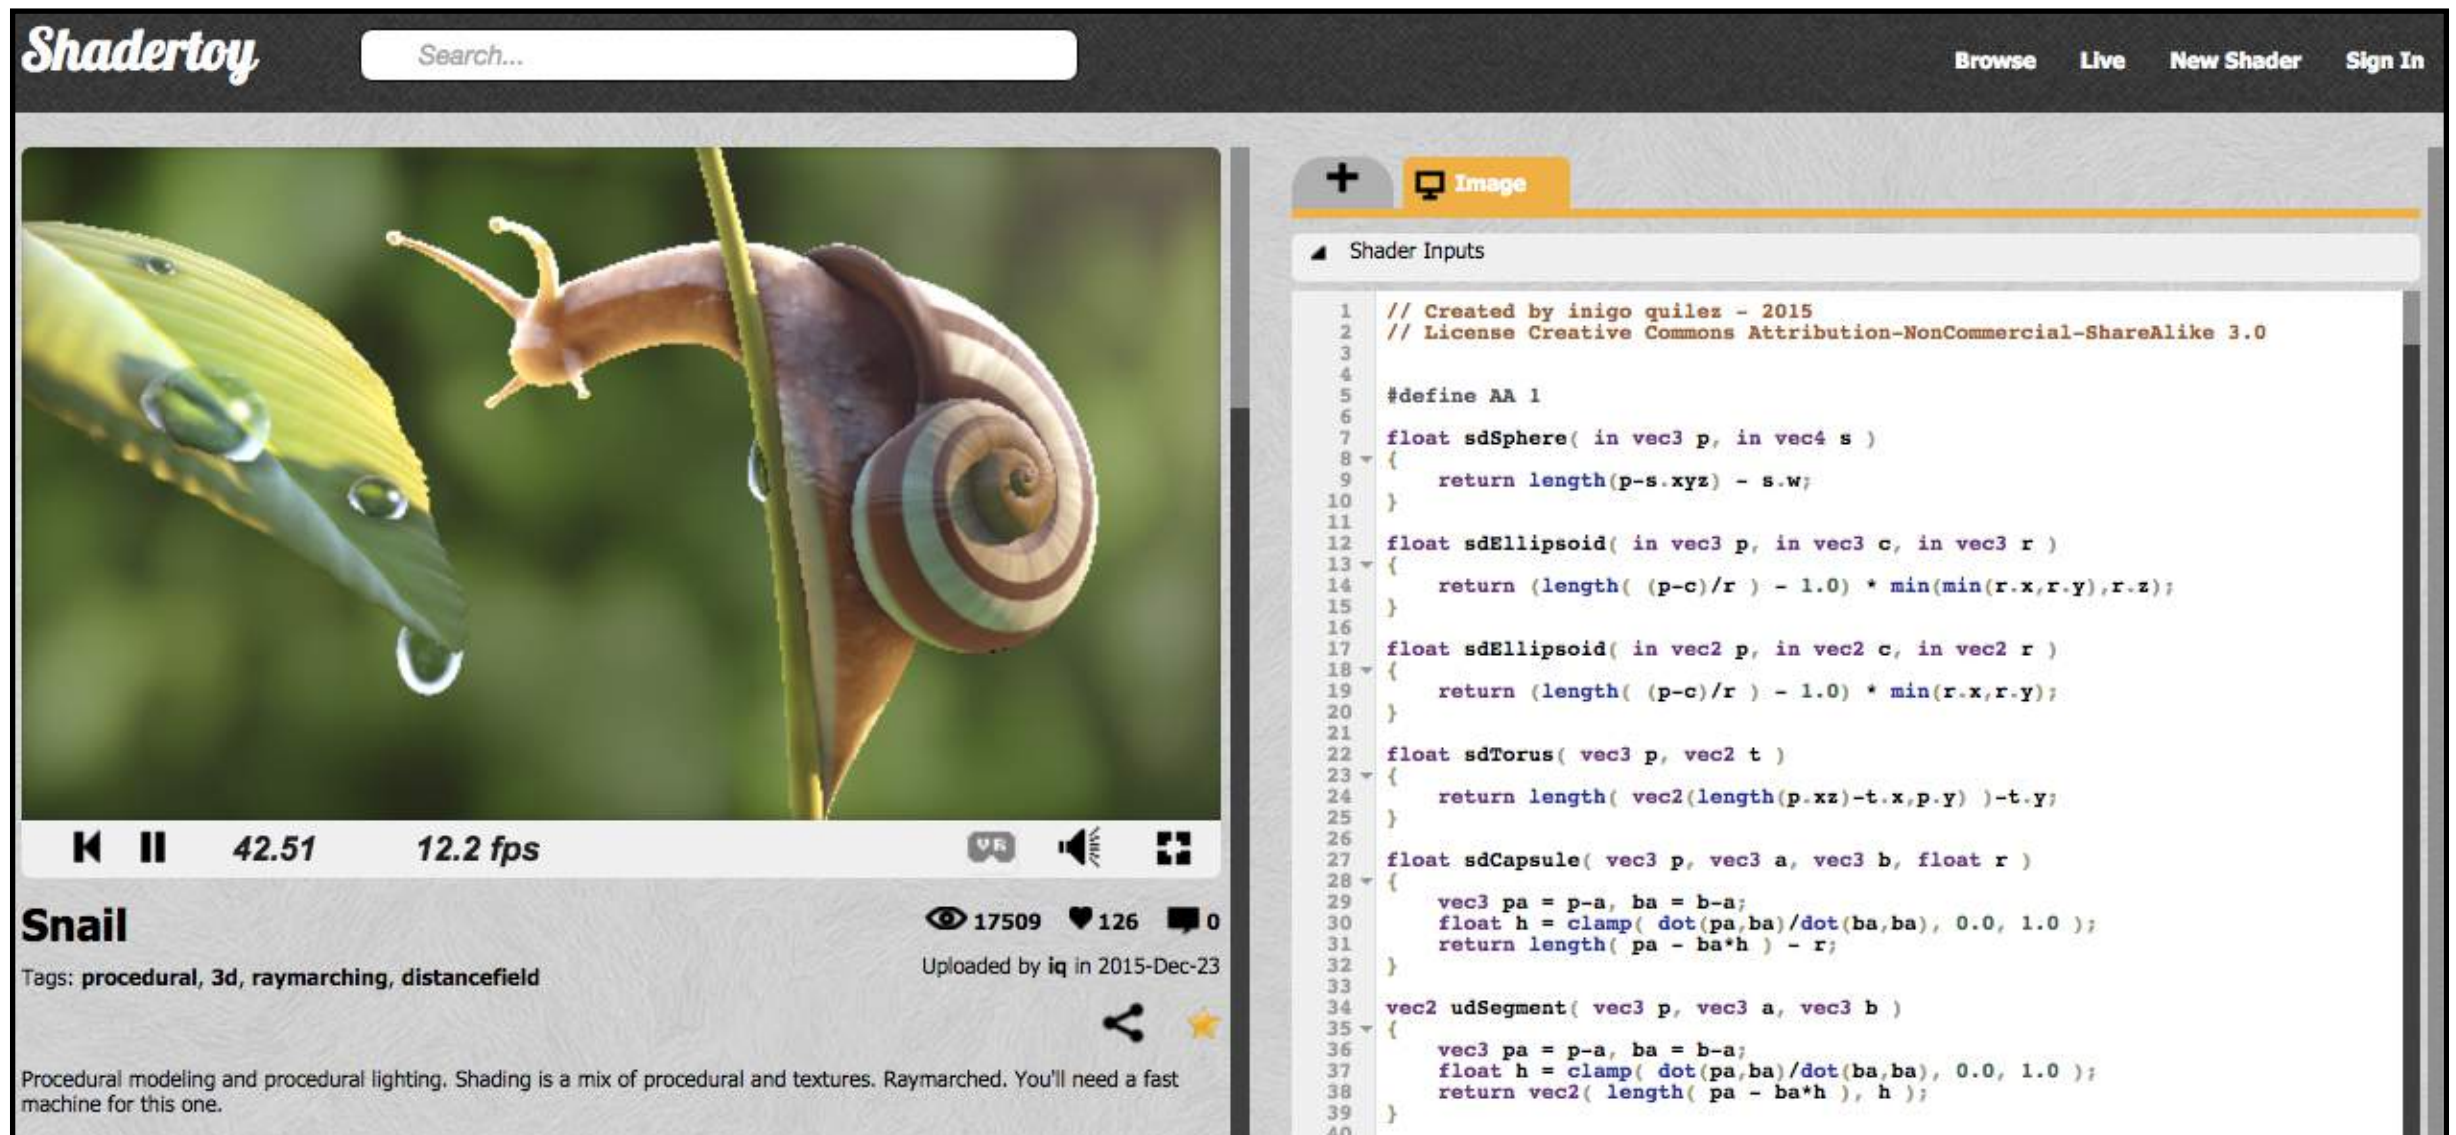

Example GLSL fragment shader program

```
uniform sampler2D myTexture;    // program parameter
uniform vec3 lightDir;         // program parameter
varying vec2 uv;               // per fragment value (interp. by rasterizer)
varying vec3 norm;             // per fragment value (interp. by rasterizer)

void diffuseShader()
{
    vec3 kd;
    kd = texture2d(myTexture, uv);    // material color from texture
    kd *= clamp(dot(-lightDir, norm), 0.0, 1.0); // Lambertian shading model
    gl_FragColor = vec4(kd, 1.0);     // output fragment color
}
```

Procedural modeling and procedural lighting. Shading is a mix of procedural and textures. Raymarched. You'll need a fast machine for this one.

**Shader Inputs**

```
1 // Created by inigo quilez - 2015
2 // License Creative Commons Attribution-NonCommercial-ShareAlike 3.0
3
4 #define AA 1
5
6 float sdSphere( in vec3 p, in vec4 s )
7 {
8     return length(p-s.xyz) - s.w;
9 }
10
11 float sdEllipsoid( in vec3 p, in vec3 c, in vec3 r )
12 {
13     return (length( (p-c)/r ) - 1.0) * min(min(r.x,r.y),r.z);
14 }
15
16 float sdEllipsoid( in vec2 p, in vec2 c, in vec2 r )
17 {
18     return (length( (p-c)/r ) - 1.0) * min(r.x,r.y);
19 }
20
21 float sdTorus( vec3 p, vec2 t )
22 {
23     return length( vec2(length(p.xz)-t.x,p.y) )-t.y;
24 }
25
26 float sdCapsule( vec3 p, vec3 a, vec3 b, float r )
27 {
28     vec3 pa = p-a, ba = b-a;
29     float h = clamp( dot(pa,ba)/dot(ba,ba), 0.0, 1.0 );
30     return length( pa - ba*h ) - r;
31 }
32
33 vec2 udSegment( vec3 p, vec3 a, vec3 b )
34 {
35     vec3 pa = p-a, ba = b-a;
36     float h = clamp( dot(pa,ba)/dot(ba,ba), 0.0, 1.0 );
37     return vec2( length( pa - ba*h ), h );
38 }
39
40
```

Inigo Quilez

Procedurally modeled, 800 line shader.

# Snail Shader Program

Inigo Quilez, <https://youtu.be/XuSnLbB1j6E>

# Goal: Highly Complex 3D Scenes in Realtime

- 100's of thousands to millions of triangles in a scene
- Complex vertex and fragment shader computations
- High resolution (2-4 megapixel + supersampling)
- 30-60 frames per second (even higher for VR)

Unreal Engine Kite Demo (Epic Games 2015)

# Graphics Pipeline Implementation: GPUs

**Specialized processors for executing graphics pipeline computations**

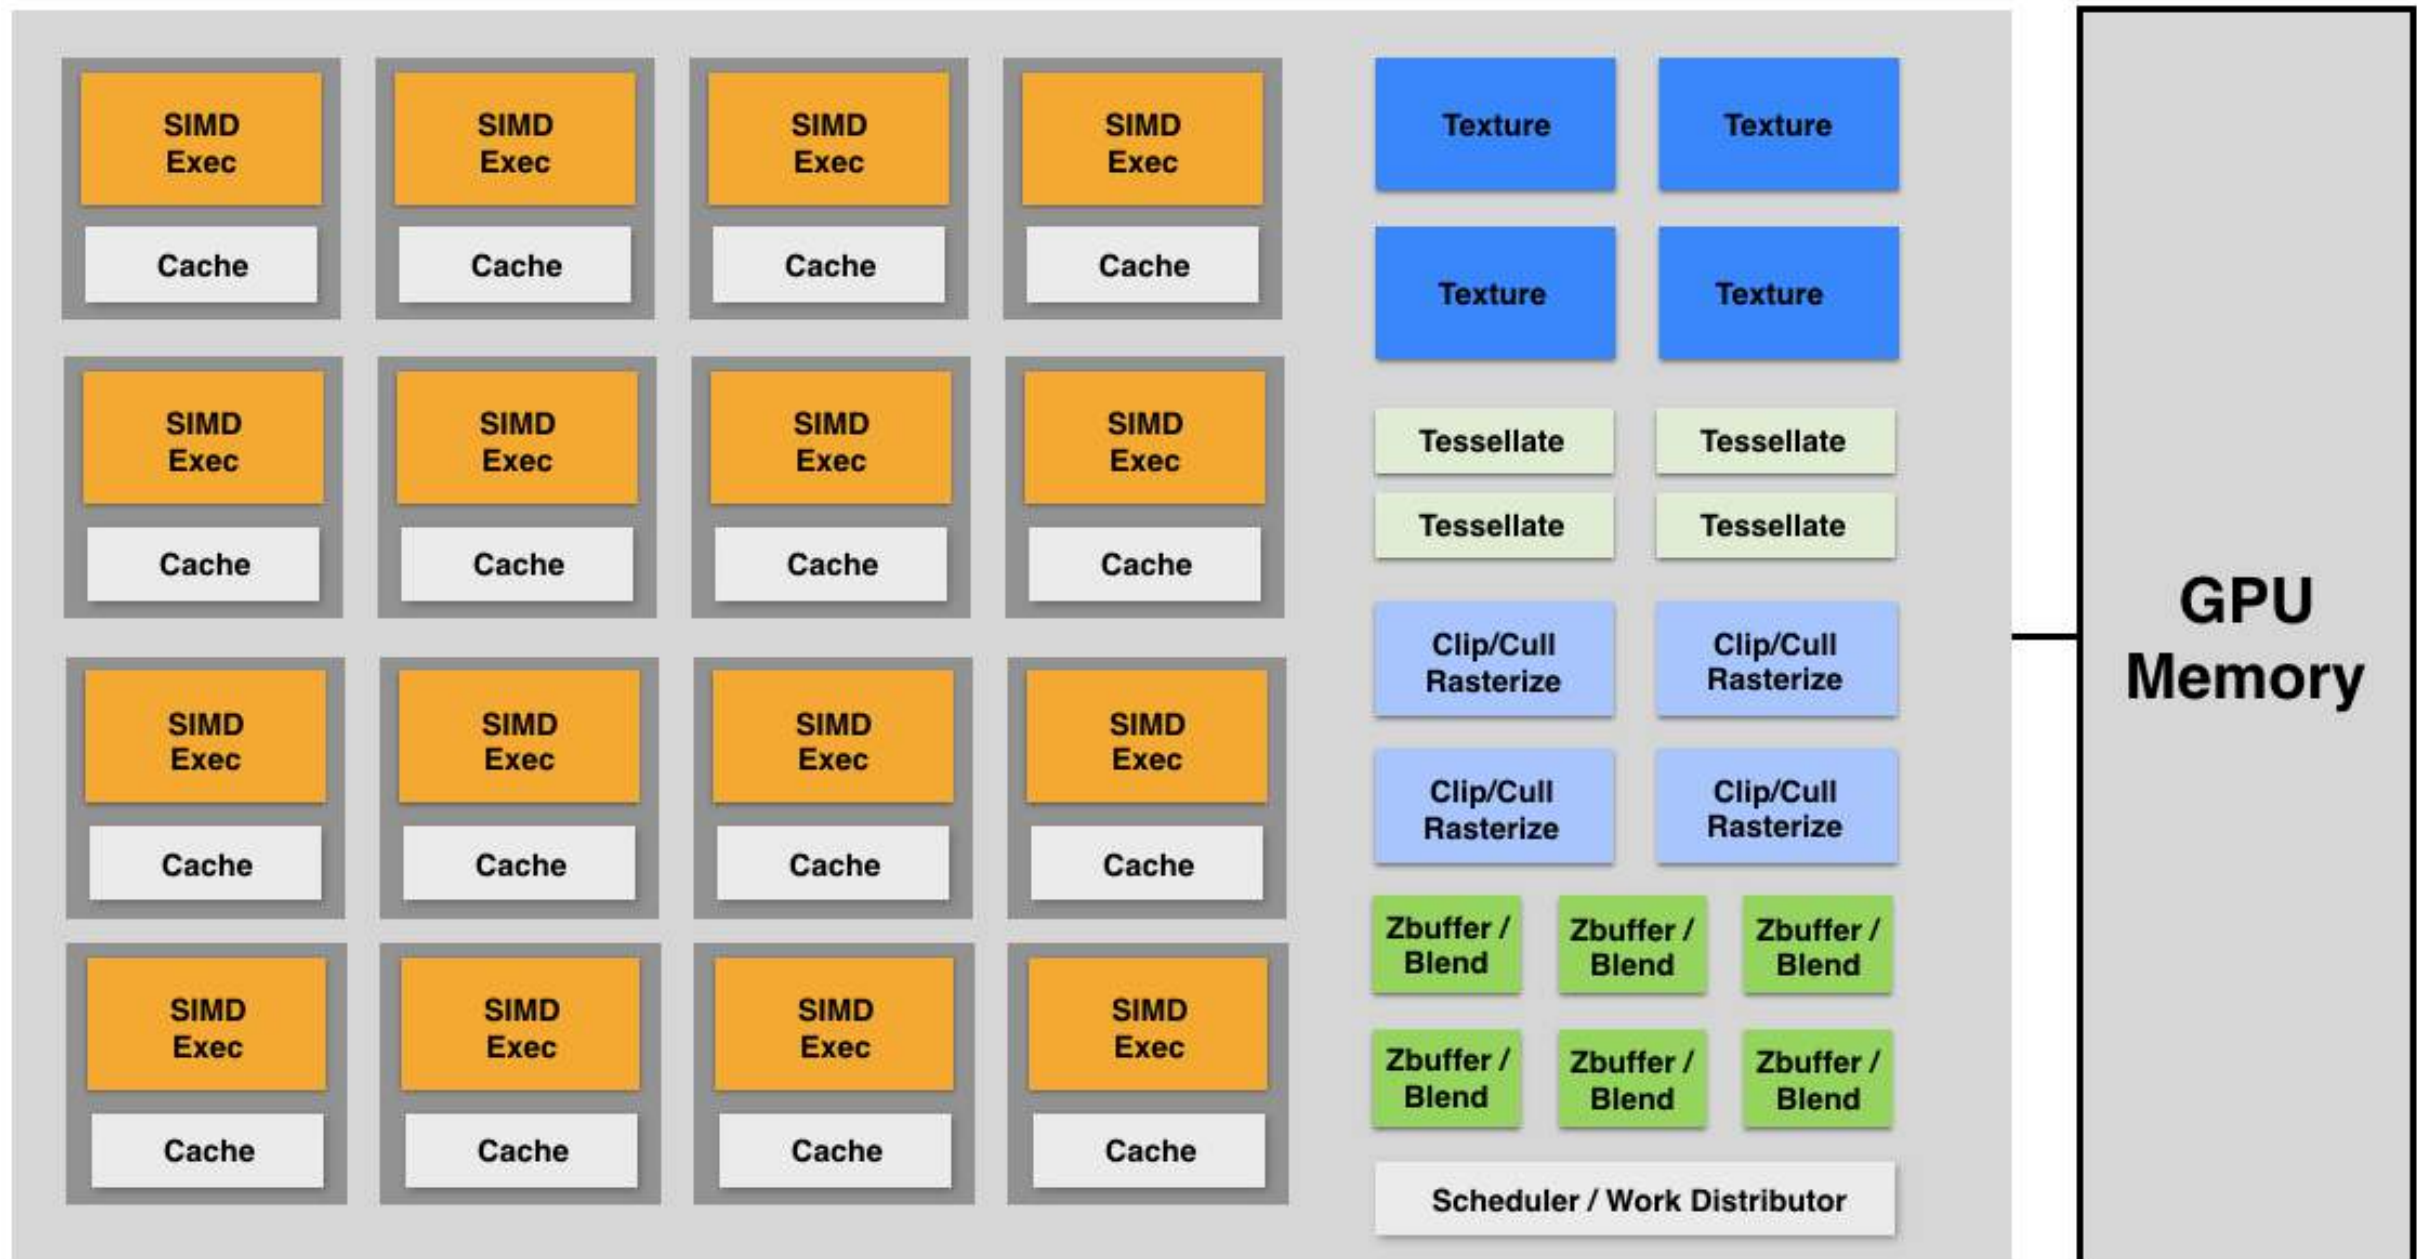

**Discrete GPU Card  
(NVIDIA GeForce Titan X)**

**Integrated GPU:  
(Part of Intel CPU die)**

# GPU: Heterogeneous, Multi-Core Processor

Modern GPUs offer ~2-4 Tera-FLOPs of performance for executing vertex and fragment shader programs

Tera-Op's of fixed-function compute capability over here

# Texture Mapping

# Different Colors at Different Places?

$$L_d = k_d * (I / r^2) * (n \cdot l)$$

Pattern on ball

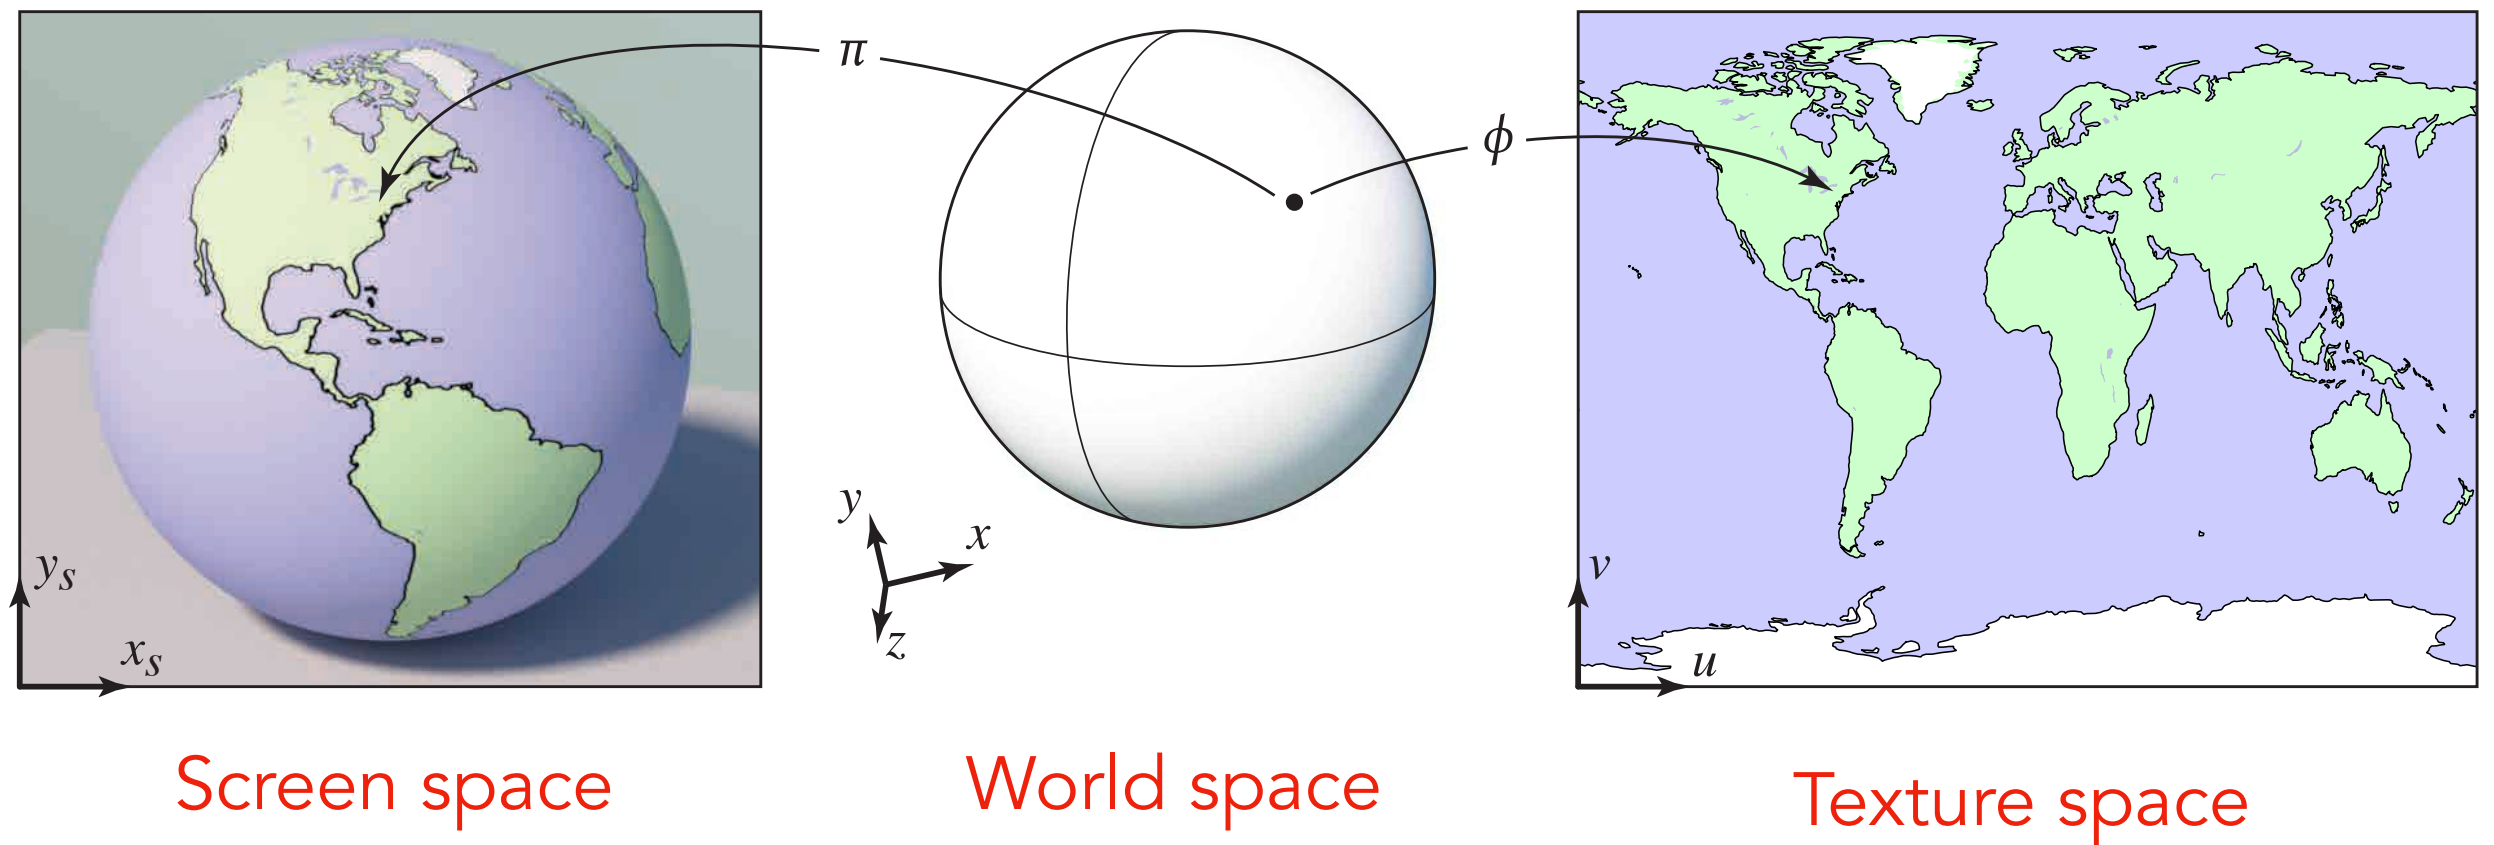

Wood grain on floor

# Surfaces are 2D

Surface lives in 3D world space

Every 3D surface point also has a place where it goes in the 2D image (**texture**).

# Texture Applied to Surface

Rendering without texture

Rendering with texture

Texture

Zoom

Each triangle "copies" a piece of the texture image to the surface.

# Visualization of Texture Coordinates

Each triangle vertex is assigned a texture coordinate  $(u,v)$

Visualization of texture coordinates

Triangle vertices in texture space

# Texture Applied to Surface

Rendered result

Triangle vertices in texture space

# Textures applied to surfaces

# Visualization of texture coordinates

# Textures can be used multiple times!

example textures  
used / **tiled**

# Thank you!

(And thank Prof. Ravi Ramamoorthi and Prof. Ren Ng for many of the slides!)
